

Basic angle rules and notation R

Acute Angles
 $0^\circ < \text{angle} < 90^\circ$

Right Angles
 90°

Obtuse
 $90^\circ < \text{angle} < 180^\circ$

Reflex
 $180^\circ < \text{angle} < 360^\circ$

Straight Line
 180°

Right angle notation

The letter in the middle is the angle
The arc represents the part of the angle

Angle Notation: three letters ABC
This is the angle at B = 113°

Line Notation: two letters EC
The line that joins E to C.

Vertically opposite angles
Equal

Angles around a point
 360°

Sum of angles at a point

The sum of angles around a point is 360°

Find angle BOE

$90^\circ + 33^\circ + 92^\circ = 205^\circ$
 $360^\circ - 205^\circ$
BOE = 155°

Angle notation - 90°

Angle notation - find this missing angle

Vertically opposite angles

Angle JNM is vertically opposite to angle KNL

$JNM = KNL$

Vertically opposite angles are the same

Alternate/ Corresponding angles

Because alternate angles are equal the highlighted angles are the same size

Because corresponding angles are equal the highlighted angles are the same size

Co-interior angles

Because co-interior angles have a sum of 180° the highlighted angle is 110°

As angles on a line add up to 180° co-interior angles can also be calculated from applying alternate/ corresponding rules first

Angle notation R

The letter in the middle is the angle
The arc represents the part of the angle

Angle Notation: three letters ABC This is the angle at B = 113°

$\angle ABC$ is also used to represent the angle at B.

Measure angles to 180° R

This is the angle being measured

The base line follows the line segment

Make sure the cross is at the point the two lines meet

Read from 0° on the base line. Remember to use estimation. This is an obtuse angle so between 90° and 180°

Keywords

- Parallel:** Straight lines that never meet
- Angle:** The figure formed by two straight lines meeting (measured in degrees)
- Transversal:** A line that cuts across two or more other (normally parallel) lines
- Isosceles:** Two equal size lines and equal size angles (in a triangle or trapezium)
- Polygon:** A 2D shape made with straight lines
- Sum:** Addition (total of all the interior angles added together)
- Regular polygon:** All the sides have equal length; all the interior angles have equal size.

Y10 FOUNDATION HT2 ANGLES

Sum of angles in triangles

Sum of interior angles in a triangle = 180°

The two base angles will be the same size

Look at triangle notation. This indicates an isosceles triangle

$$\therefore 180 - 43 = 137$$

$$137 \div 2 = 68.5^\circ$$

A triangle can only have ONE right angle

Have a go!

Tearing the corners from triangles forms a straight line which is therefore 180°

Sum of exterior angles

Exterior angles all add up to 360°

Using exterior angles

Exterior Angle

$$\text{Interior angle} + \text{Exterior angle} = \text{straight line} = 180^\circ$$

$$\text{Exterior angle} = 180 - 165 = 15^\circ$$

Interior Angle

$$\text{Number of sides} = 360^\circ \div \text{exterior angle}$$

$$\text{Number of sides} = 360 \div 15 = 24 \text{ sides}$$

Exterior Angles

Are the angle formed from the straight-line extension at the side of the shape

Sum of angles in quadrilaterals

Sum of interior angles in a quadrilateral = 360°

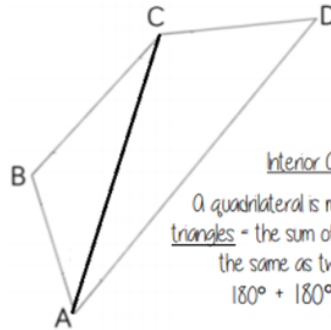

Convex Quadrilateral

Concave Quadrilateral

Interior angles are those that make up the perimeter (outline) of the shape

Interior Angles

A quadrilateral is made up of two triangles - the sum of interior angles is the same as two triangles: $180^\circ + 180^\circ = 360^\circ$

Sum of interior angles

$(\text{number of sides} - 2) \times 180$

Interior Angles

The angles enclosed by the polygon

This is an irregular polygon - the sides and angles are different sizes

$$\text{Sum of the interior angles} = (5 - 2) \times 180$$

This shape can be made from three triangles. Each triangle has 180°

$$\text{Sum of the interior angles} = 3 \times 180 = 540^\circ$$

Remember this is **all** of the interior angles added together

Understand and represent bearings

- A bearing is always measured from **NORTH**
- It is always given as three figures

The bearing of B from A is calculated by measuring the highlighted angle

The angle indicated starts from the North line at A and joins the path connecting A to B.

This angle shows the bearing of B from A

The sentence... "Bearing of ___ from ___" is really important in identifying the bearing being represented

Using **estimation** it is clear this angle is between 090° and 180°
